Pham Tien Anh

Software Engineer

phama9162@gmail.com Ho Chi Minh City 0856230326 t9tieanh.io.vn

SUMMARY

Software Engineer with experience in the banking domain, building scalable systems with Spring Boot, Node.js, NestJS,... and microservice architecture. Hands-on with event-driven messaging, background processing, workflow orchestration and horizontally scalable services on platforms such as Kubernetes. Interested in cloud technologies and in applying AI to real products, including RAG, chunking strategies and LLM integration.

WORK EXPERIENCE

GEEK Up geekup.vn 09/2025 – Present

Product Backend

Real Estate Content Platform

Directus, Node.js, BullMQ, OpenShift/Kubernetes, Jenkins, GitLab CI

- Built the CMS for a B2B2C platform that helps home buyers find properties and get financing. It supplies property data to the backend and mobile apps, and manages partner promotions and advertising that bring in more users.
- Built queue-based background jobs (BullMQ) that sync listings and media from partner portals over FTP to enrich property data, distributing heavy ingestion across workers in batches of up to 200 image and video files, capped at 6 GB per run. The workers are designed to scale horizontally on Kubernetes.
- Set up GitLab CI/CD pipelines on the company's internal GitLab to build and deploy automatically to the dev and staging environments.
- Worked directly with client stakeholders to clarify requirements and plan releases. Deployed releases to the client's OpenShift/Kubernetes environment through their Jenkins pipelines.

Digital Onboarding Platform

Spring Boot, Camunda (BPMN), RabbitMQ, Microservices, AWS S3, GitLab CI

- Developed Spring Boot microservices for a system that helps users submit applications to open new loans and lets the bank monitor those loans after disbursement, using Camunda to orchestrate loan applications across services through each processing stage and on to multiple internal and partner systems such as the CRM and the core banking system.
- Used RabbitMQ for asynchronous, event-driven communication between services, which keeps them loosely coupled, and AWS S3 to store loan documents.
- Applied design patterns such as Strategy and Factory to keep the codebase extensible, and used shared API contracts to keep API specs consistent across services, making integration easier for the frontend team and external systems.
- Set up GitLab CI/CD pipelines on the internal GitLab for the dev and staging environments of each service.

BIT GROUP bit.com.vn 06/2025 – 09/2025

Fullstack Developer Intern

- Built booking APIs for a sports venue booking platform with Redis caching, Socket.IO real-time updates and OAuth2.
- Used Redis distributed locks to prevent race conditions when users book the same slot concurrently.

PROJECTS

Learnova – Collaborative E-Learning System 09/2025 – Present

Fullstack Developer

Microservices, Spring Boot, NodeJS, gRPC, RabbitMQ, Redis, Saga Transaction, AWS S3/CloudFront

- Microservice platform that combines e-commerce and LMS. Instructors create and sell courses, and learners buy courses, study the video lessons and join real-time communities.
- **AI learning assistant:**
  - Lecture videos are transcribed, and semantic chunking splits each transcript into topic-based sections.
  - Students can ask questions about course content, and RAG answers them from the lectures.
- **Backend architecture:**
  - Designed the microservice architecture around clear domain boundaries such as Course, Sale and Notification, so each service can be scaled on its own based on feature load.
  - Videos and file assets are managed with AWS S3 and CloudFront CDN. Large files are uploaded in chunks, and S3 presigned URLs let clients upload and download directly.
  - Saga pattern keeps services consistent through the course purchase flow.
  - gRPC for synchronous calls between services, RabbitMQ for async events.
- Set up CI/CD with GitHub Actions to deploy automatically.

SKILLS

Languages	Java, TypeScript, JavaScript
Backend	Spring Boot, NestJS, Node.js/Express, Directus, Camunda (BPMN)
Architecture	Microservices, gRPC, RabbitMQ, Saga pattern, background jobs (BullMQ), REST
Databases	PostgreSQL, MySQL, MongoDB, Redis
DevOps & Cloud	OpenShift/Kubernetes (development), Docker, GitLab CI, GitHub Actions, AWS (EC2, S3, CloudFront), Linux
AI	RAG, chunking strategies, LLM integration

EDUCATION

HCMC University of Technology and Education – HCMUTE

Software Technology

*Graduated with **High Distinction** · **GPA 3.68/4.0***

Academic Encouragement Scholarship (2 semesters)

CERTIFICATIONS

AWS Academy Graduate – Cloud Developing Credly

AWS Academy Graduate – Cloud Foundations Credly

TOEIC: 680
